

AI Output Evaluation Case

Prepared by: Thais Granado | Date: 12 March 2026

1. Task Overview

This case presents a structured evaluation of an AI-generated response. The objective is to assess the quality, reliability and potential risks associated with the output.

2. User Prompt

| “What are the benefits of using artificial intelligence in decision-making?”

3. AI Response (Summary)

The AI response highlighted the following points:

- Faster decision-making
- Improved efficiency
- Ability to analyse large volumes of data
- Support for data-driven insights

The response was clear and well structured, but lacked depth and supporting detail.

4. Evaluation

Dimension	Rating	Notes
Accuracy	Partially accurate	The response correctly identifies general benefits of AI but does not provide examples or evidence to support the claims.
Clarity	Clear	The structure is logical and the information is presented in a simple and accessible way.
Bias	Low bias	The response presents AI positively but does not include limitations or risks, creating an unbalanced perspective.
Hallucination	Not detected	The response includes general statements that are not supported by specific facts or references.

Risk	Medium	The lack of balance may lead to over-reliance on AI without proper validation. Key limitations such as data quality and human oversight are not mentioned.
-------------	--------	--

5. Decision

| The response requires improvement before being used.

6. Recommendations

- Include practical examples to support claims.
- Add limitations and risks of AI usage.
- Provide a more balanced view of benefits and challenges.
- Reinforce the importance of human judgement.

7. Final Note

AI-generated responses should not be accepted without evaluation.

Human judgement is essential to ensure accuracy, reliability and responsible decision-making.
